S. B. JAIN INSTITUTE OF TECHNOLOGY, MANAGEMENT & RESEARCH, NAGPUR.

Practical No. 11

Aim: To use Otter.ai to convert spoken words into written text, and check how well it works for taking notes during meetings, lectures, or interviews.

Name of Student:

Roll No.:

Semester/Year: VI/III

Academic Session:

Date of Performance:

Date of Submission:

AIM: Implement Linear Regression to predict continuous values using a given dataset.

OBJECTIVE/EXPECTED LEARNING OUTCOME:

The objectives and expected learning outcome of this practical are:

- To understand the concept of supervised learning.
- To understand Linear Regression and its importance in Machine Learning.
- To learn the relationship between dependent and independent variables.
- To implement Linear Regression using Python.
- To evaluate model performance using error metrics.
- To visualize regression results using graphs.

THEORY:

Introduction to Otter.ai

Otter.ai is an **AI-powered automatic transcription service** that converts spoken language into written text in real-time . It is widely used as a meeting assistant that can join virtual calls on platforms like Zoom, Google Meet, and Microsoft Teams to automatically record audio, take notes, capture slides, and generate summaries .

In simple words: Otter.ai listens to conversations and types out what people say, so you don't have to take manual notes.

Otter.ai uses two main Artificial Intelligence technologies:

A. Automatic Speech Recognition (ASR)

- This technology converts human speech into text .
- The system analyzes audio waves and matches sound patterns to words.
- It works similarly to how Siri or Google Assistant understand your voice, but Otter is specifically designed for transcribing human-to-human conversations rather than human-to-robot commands .

B. Natural Language Processing (NLP)

- This helps the AI understand context, sentence structure, and meaning .
- NLP enables Otter to add proper punctuation, capitalize sentences, and identify key topics.
- It also powers features like automatic summarization and action item detection

Advantages

1. Saves time – No need to take manual notes during meetings or lectures
2. Real-time transcription – Converts speech to text instantly
3. Speaker identification – Knows who said what
4. Automated summaries – Generates key points and action items automatically
5. Searchable transcripts – Find any word or phrase quickly
6. Integration with Zoom/Teams/Google Meet – Works directly with meeting platforms
7. Collaboration – Multiple users can edit and share notes
8. Accessibility – Helps deaf/hard-of-hearing students follow conversations

Overview

The lecture introduces Java programming language, covering basic concepts such as binary and decimal representations, variables, and data types. It emphasizes the importance of downloading tools like VS Code and the Java Development Kit (JDK) for different operating systems. The speaker explains the structure of a Java program, including the public static void main function and the use of arguments. The process of compiling and executing Java code is detailed, highlighting the roles of the Java Runtime Environment (JRE), Java Virtual Machine (JVM), and the byte code. The lecture concludes with a brief mention of the next steps in learning Java.

Action Items

- [ ] Share download links and setup instructions for Java Development Kit (JDK) and Visual Studio Code (including relevant installer links for Windows, macOS, and Linux) so students can install and run Java code

+ Add action item

Outline

Introduction to Java Language Lecture 1

- Speaker 1 explains the basics of binary and decimal representations, mentioning how numbers from 0 to 3 can be represented in binary and decimal.
- The conversation shifts to the concept of variables and data types, with Speaker 1 emphasizing the importance of variables in storing input data.
- Unknown Speaker and Speaker 1 discuss the need for software tools like VS Code and the Java Development Kit (JDK) for coding in Java.
- Speaker 1 provides a step-by-step guide on downloading and installing the necessary tools for Java development, including different formats for various operating systems.
- The discussion covers the structure of a basic Java program, including the public static void main function and the concept of arguments in Java.
- Speaker 1 explains the process of compiling and executing Java code, highlighting the roles of the Java Runtime Environment (JRE), Java Virtual Machine (JVM), and the byte code.

CONCLUSION:

DISCUSSION QUESTIONS:

1. What is Linear Regression?

2. Difference between simple and multiple regression?

3. What is the role of slope and intercept?

4. What are error metrics in regression?

5. What are limitations of Linear Regression?
